

Everly AI Carrier Representative

MDR API Integration Workload and Timeline

Below is a practical breakdown of the expected API work, key validation rules, dependencies, and estimated timeline for one developer from our team.

1. API Endpoint Breakdown

The endpoints below are separated into read access, write access, configuration, and supporting integration work. The final route naming can be adjusted to match MDR conventions.

A. Load Details API

Endpoint	GET /api/everly/loads/{load_id}
Purpose	Allow Everly to understand the load before calling carriers.
Main data / logic	Pickup and delivery details, timing, equipment, cargo, service scope, pricing rules, disclosure settings, and quote threshold.
Estimated effort	1.5 to 2 working days
Implementation notes	This requires careful mapping from MDR load, quote, service, and account tables.

B. Load Quote Status API

Endpoint	GET /api/everly/loads/{load_id}/quote-status
Purpose	Tell Everly whether the load still requires additional carrier quotes.
Main data / logic	Required quote threshold, current valid quote count, remaining quote count, and a clear allow/stop calling flag.
Estimated effort	0.75 to 1 working day
Implementation notes	The logic must follow MDR quote rules so carriers are not called after the threshold has already been reached.

C. Carrier Details / Eligibility API

Endpoint	GET /api/everly/carriers and GET /api/everly/carriers/{carrier_id}
Purpose	Provide Everly with carrier contact details and eligibility information.
Main data / logic	Carrier name, phone, email, MC/USDOT, insurance status, eligibility flags, do-not-call status, lanes, equipment capabilities, and service history where available.
Estimated effort	2 to 3 working days
Implementation notes	This is one of the more sensitive parts because ineligible, inactive, uninsured, or do-not-call carriers must be filtered properly.

D. Existing Quotes for a Load API

Endpoint	GET /api/everly/loads/{load_id}/quotes
Purpose	Prevent duplicate outreach to carriers who have already responded.
Main data / logic	Carrier ID, carrier email, quote source, quote status, quoted amount, and submitted timestamp.
Estimated effort	1 to 1.5 working days
Implementation notes	Deduplication should consider carrier ID and email so Everly does not call a carrier who already quoted by another channel.

E. Submit Quote API

Endpoint	POST /api/everly/loads/{load_id}/quotes
Purpose	Allow Everly to submit a confirmed carrier quote into MDR.
Main data / logic	Base rate, fuel, chassis, accessorials, total, capacity, validity, service scope, carrier confirmation flag, load ID, carrier ID, and source as Everly.
Estimated effort	3 to 4 working days
Implementation notes	This is the most important write endpoint. It needs validation, duplicate prevention, price calculation checks, quote status handling, and audit trail.

F. Carrier Do-Not-Call Update API

Endpoint	PATCH /api/everly/carriers/{carrier_id}/do-not-call
Purpose	Save a carrier opt-out request captured during the call.
Main data / logic	Do-not-call flag, reason, source, timestamp, and updated-by integration user.
Estimated effort	0.5 to 1 working day
Implementation notes	The flag should be global within MDR so future outreach through any MDR channel respects the opt-out.

G. Account Settings API

Endpoint	GET /api/everly/accounts/{account_id}/settings and PATCH /api/everly/accounts/{account_id}/settings
Purpose	Provide account-specific calling and negotiation rules to Everly.
Main data / logic	Quote threshold, email wait time, max call attempts, calling window, voicemail policy, disclosure policy, and negotiation authority.
Estimated effort	2 to 3 working days
Implementation notes	Some of these settings may need to be newly added if they are not already stored at broker/shipper account level.

2. Scope Summary

Primary objective	Expose controlled MDR endpoints for Everly to support carrier outreach and quote capture.
Integration style	Server-to-server API integration using staging credentials first, then production credentials after testing.
Main areas of work	Load data, quote status, carrier eligibility, existing quote checks, quote submission, do-not-call update, and account-level calling settings.
Estimated timeline	Approximately 12 to 15 working days for one developer, including testing and coordination.
Main dependency	Final confirmation of Everly request/response payloads, authentication method, and test data requirements.

3. Supporting Integration Work

In addition to the endpoint development, we should plan time for the integration layer, staging setup, test data, and coordination with the Everly team.

Authentication: API key or token-based authentication for Everly, preferably with restricted permissions.

Staging credentials: separate sandbox access with test loads, test carriers, and test quote submissions.

Logging: record all read/write activity from Everly for troubleshooting and audit purposes.

4. Estimated Timeline

Workstream	Estimated Effort	Notes
Review existing MDR data structure	1 working day	Confirm tables, quote rules, carrier status fields, and account settings.
Read API endpoints	5 to 7 working days	Load details, quote status, carriers, and existing quotes.
Write API endpoints	3.5 to 5 working days	Quote submission and carrier do-not-call update.
Account settings API	2 to 3 working days	Depends on whether all settings already exist in MDR.
Authentication and staging setup	1 to 1.5 working days	API credentials, sandbox data, access restrictions.
Testing and coordination	2 to 3 working days	Joint testing with Everly team and fixes after first integration run.

Overall estimate: **approximately 12 to 15 working days for one developer**. This assumes the core MDR data is already available and no major database restructuring is required.

5. Dependencies / Confirmation Needed

Before starting full development, we should confirm the following with the Everly team:

- Preferred authentication method and token refresh approach, if any.
- Exact JSON request and response format expected by Everly.
- Whether Everly needs load push notifications or will pull loads from MDR.
- How Everly will handle failed calls, voicemail, retries, and escalation cases.
- Final rules for negotiation authority and disclosure policy by account.
- Staging credentials, sample calls, and required test scenarios.
